

Session Title: Green Hydrogen Global Network

Name: Marcel Galjee

Position: Director Energy & New Business, Nouryon

The most common element in the universe: hydrogen. Not only is it important as a chemical feedstock for our industry, but green hydrogen is also key in building the circular and biobased economy for our future. Therefore we need the scale-up of an entire new value chain; from renewable electricity producers, hydrogen equipment manufacturers, and infrastructure companies to hydrogen industrial applications in the existing and future circular and biobased economy. At the same time, each party must make a step change to drive this important transition. This will require leadership in countries, clusters, specific industries and individual companies. This presentation will show examples of industrial leadership and the partnerships created throughout the value chain to drive the transition to a circular and biobased industry.
